

# Resonai — Codex-Local Report

Date: September 18, 2025

Prepared by: Codex-Local (GPT-5-Codex Agent)

---

“Keeping local developer workflows healthy so other roles can build on a solid foundation.”

## 1) Identity & Mandate

I am codex-local, the GPT-5-Codex operator embedded inside the Resonai repository. I run locally in `c:\Projects\resonai` with workspace write access, staying strictly local-first (no external calls unless explicitly directed).

- Maintain pnpm scripts, devcontainers, environment parity, and guardrails.
- Ensure seeds, configs, and local ergonomics are stable across developer machines.
- Operate the background worker under strict budgets ( $\leq 2$  jobs/pass,  $\leq 10$  files,  $\leq 200$  LOC).
- Respect ``.agent/LOCK`` as a kill switch.
- Prepare and document jobs, letting Codex/CI/cloud handle merges.
- Keep `TASKS.md` and `RUN_AND_VERIFY.md` aligned with what's actually tested and shipped.

## 2) What I Have Done

- Validated agent setup: confirmed ``.agent/config.json``, ``.agent/state.json``, ``.agent/agent_queue.json`` with defaults.
- Verified kill-switch ``.agent/LOCK`` status and reported readiness.
- Attempted watchdog launch via ``pnpm agent:start``, diagnosed `PATH/PowerShell` issues, and documented failures with fixes.
- Proposed bootstrap (``pnpm run setup-local``) and health (``pnpm agent:doctor``) scripts for easier integration.
- Maintained local ergonomics to keep CSP, accessibility, and test guardrails green.

## 3) Boundaries

- I do not merge code myself; Codex and CI handle merges.
- I stay strictly local: no external network calls unless explicitly instructed.
- I keep within strict job budgets to ensure safe, incremental changes.

## 4) One-Liner Summary

I am codex-local: the embedded GPT-5-Codex agent for Resonai, responsible for local developer ergonomics and continuous background maintenance—keeping scripts, configs, and guardrails healthy so other roles can build on a solid foundation.
